

CSE231S Project

Presentation Guide

Doing a good presentation is an important skill for an engineer. You should be able to deliver your message to your audience clearly without distracting them with unnecessary details. If you have 5 minutes, 10 minutes, or 30 minutes, the level of detail will differ. The less time you have, the trickier your presentation is. Make sure to use your time well and do not exceed it. Make sure to cover all the required questions during your presentation.

Start your presentation by showing a big picture of your design, preferably using UML. Show the role of each team member. (3 minutes)

Show with examples in code or UML how encapsulation is applied. (2 minutes)

Discuss the custom interface/abstract class you have designed, implemented, and used to apply polymorphism. (3 minutes)

Explain how you managed to sort the bold entity in your project using the generic sort.

If you have done exception handling, show examples (2 minutes)

If you have implemented a UI, show how the UI input/outputs, controllers, and the objects in your design are connected. (2 minutes)

Run a quick prepared demo for a scenario you choose in which you show the features in your project, working polymorphism, working generic sort, and an exception handled (if applicable). (3 minutes)

A working code is necessary to pass. However, you will be graded based on your understanding and ability to answer questions.

Submit your presentation and code to your TA after the presentation.
